## PROJECT PROFILE

**PROJECT:** Center Parcs - Water Slide Refurbishment  
**LOCATION:** Germany

### THE PROBLEM

The original coating, which had been used to protect the concrete water slide at this Center Parcs site in Northern Germany, had begun to breakdown as a result of abrasion and impact damage caused by the rapid-flowing water and other objects.

Center Parcs required a high performance coating system that would offer long-term protection and colour stability.

### THE SOLUTION

The existing coating was completely abraded back to the bare concrete substrate, after which Floor-Tech FB Primer was applied. The primed substrate was then overcoated with Floor-Tech FB. Floor-Tech FB is a solvent-free, ceramic-reinforced polyurethane coating which offers outstanding abrasion, impact and chemical resistance.

A topcoat of Floor-Tech PU was finally applied to give the system a flexible, colour stable finish.

Even after more than three years of service, the water slide is still in excellent condition.
