PROJECT PROFILE

PROJECT: Water Tower Refurbishment
LOCATION: Portugal

THE PROBLEM

Due to the effects of the environment and time, the external concrete walls of this water tower were in need of refurbishment.

A solution was sought which would offer long-term protection and superior resistance to the elements.

THE SOLUTION

The external surface of the water tower was suitably prepared to ensure that the substrate was clean, dry and free from contamination. The walls were then primed with Uni-Tech GP Primer prior to the application of Wall-Tech FP.

Whilst Wall-Tech FP is micro-porous thus allowing the substrate to breathe, it still has outstanding waterproofing, weatherproofing and anti-carbonation properties. The Wall-Tech FP system offers superior adhesion to external masonry surfaces and optimum levels of flexibility and durability.
